DESCRIPTORS: \*Naphthenic acids, Acids, \*Desiccants, Manganese, Calcium, Zinc, Iron, Lead, Preparation, Tests, Corrosion.

Distillation of acidol [crude naphthenic acids, in mixture with naphthenates] under a residual pressure of 50-15 mm. mercury was found in pilot plant experiments to give up to 88.8% light-colored naphthenic acids. A high activity of the combined manganese-calcium-iron siccative was established, exceeding that of the standard manganese-calcium siccative. (Engineering--Chemical, TT, v. 7, no. 10) (over)

Experiments indicated that in the process of hydrogenation of fats there is virtually no reesterification. The nickel and copper-nickel hydrogenation catalysts have no effect on the reesterification process. The slight reesterification is explained by a high hydrogenation temperature.
